GRADE 98.33%

## Bird recognition in the city of Peacetopia (case study)

98.33%

## 1- Problem Statement

1/1 point

This example is adapted from a real production application, but with details disguised to protect confidentiality.

You are a famous researcher in the City of Peacetopia. The people of Peacetopia have a common characteristic they are adraid of birds. To save them, you have to build an algorithm that will detect any bird flying over Peacetopia and alert the population.

The City Council gives you a dataset of 10,000,000 images of the sky above Peacetopia, taken from the city's security cameras. They are labelled:

- y = 0: There is no bird on the image
- y = 1: There is a bird on the image

Your goal is to build an algorithm able to classify new images taken by security cameras from Peacetopia.

There are a lot of decisions to make:

- What is the evaluation metric?
- How do you structure your data into train/dev/test sets?

## Metric of success

The City Council tells you that they want an algorithm that

- 1. Has high accuracy
- 2. Runs quickly and takes only a short time to classify a new image.
- 3. Can fit in a small amount of memory, so that it can run in a small processor that the city will attach to many different security cameras.

Note: Having three evaluation metrics makes it harder for you to quickly choose between two different algorithms, and will slow down the speed with which your team can iterate. True/False?

O False

2. After further discussions, the city narrows down its criteria to:

1 / 1 point

- "We need an algorithm that can let us know a bird is flying over Peacetopia as accurately as possible."
- "We want the trained model to take no more than 10sec to classify a new image."
- "We want the model to fit in 10MB of memory."

If you had the three following models, which one would you choose?

0	Test Accuracy	Runtime	Memory size
	97%	1 sec	3MB
0	Test Accuracy	Runtime	Memory size
	99%	13 sec	9MB
0	Test Accuracy	Runtime	Memory size
	97%	3 sec	2MB
•	Test Accuracy	Runtime	Memory size
	98%	9 sec	9MB

Correct! As soon as the runtime is less than 10 seconds you're good. So, you may simply maximize the test

O A				g would you say is true?	
_	Accuracy is an o	optimizing met	ric; running tim	e and memory size are a satisficing metrics.	
O A	Accuracy is a sa	itisficing metri	; running time	and memory size are an optimizing metric.	
	Accuracy, runni	ing time and m	emory size are	all optimizing metrics because you want to do well on all three.	
	Accuracy, runni hree for your s			all satisficing metrics because you have to do sufficiently well on all

13. It turns out Peacetopia has hired one of your competitors to build a system as well. Your system and your competitor both deliver systems with about the same running time and memory size. However, your system has hi
<ul> <li>Look at all the models you've developed during the development process and find the one with the lowest false negative error rate.</li> </ul>
Ask your team to take into account both accuracy and false negative rate during development.
Rethink the appropriate metric for this task, and ask your team to tune to the new metric.
Pick false negative rate as the new metric, and use this new metric to drive all further development.
✓ Correct
14. You've handily beaten your competitor, and your system is now deployed in Peacetopia and is protecting the citizens from birds! But over the last few months, a new species of bird has been slowly migrating into the area, so the performance of your system slowly degrades because your data is being tested on a new type of data.
You have only 1,000 images of the new species of bird. The city expects a better system from you within the next 3 months. Which of these should you do first?
Use the data you have to define a new evaluation metric (using a new dev/test set) taking into account the new
species, and use that to drive further progress for your team.
Put the 1,000 images into the training set so as to try to do better on these birds.  Try data augmentation/data synthesis to get more images of the new type of bird.
Add the 1,000 images into your dataset and reshuffle into a new train/dev/test split.
O not the 1,000 mages into your dataset and resistante into a new dainy devices spirit.
✓ Correct
15. The City Council thinks that having more Cats in the city would help scare off birds. They are so happy with your work on the Bird detector that they also hire you to build a Cat detector. (Wow Cat detectors are just incredibly useful arent they.) Because of years of working on Cat detectors, you have such a huge dataset of 100,000,000 cat images that training on this data takes about two weeks. Which of the statements do you agree with? (Check all that agree.)
<ul> <li>Having built a good Bird detector, you should be able to take the same model and hyperparameters and just apply it to the Cat dataset, so there is no need to iterate.</li> </ul>
If 100,000,000 examples is enough to build a good enough Cat detector, you might be better of training with just 10,000,000 examples to gain a ≈ 10x improvement in how quickly you can run experiments, even if each model performs a bit worse because it's trained on less data.
✓ Correct
Needing two weeks to train will limit the speed at which you can iterate.
✓ Correct
Buying faster computers could speed up your teams' iteration speed and thus your team's productivity.
✓ Correct
